

What Would Be the Reproduction Rate of Rabbits On an Earth with No Animal Death If The Rabbits Were Fruitful and Multiplied?

Reproduction Rates of Rabbits

Females Can breed at	4 Months
Gestation Period	30 Days
Possible Litters per Year	12
Average Litter size	7
Per Cent Female	50%

In five years one initial pair of rabbits with no deaths among their offspring would produce approximately 918,000 rabbits for each square mile of the earth's dry land (including Antarctica).
